I built a working prototype of a Concepts Framework Engine, and am allowing it to grow into a Large Concepts Model.

It has actually grown beyond prototype, because I've added many useful features for scaling, administration and other important features. Right now, it's built in two versions:
 concepts-core, which contains all the features needed for training and inference. Abd concepts-enterprise, which has features for database and for cloud/load-balancing modules.

So I applied for a patent. I haven't decided how to distribute the two versions yet.
